Manual for the "Give Me Some Credit" Project

The current folder has three other folders (**Dataset, Output and Script**)
- The Dataset folder contain our raw training and test datasets
- The Scripts folder contains one R script and one R markdown script. Both are essentially the same with the only difference being that the R markdown when executed generates a beautiful html output of our code and the result.
- The result of our run can be found in the Output folder. It is a html file that shows the code and the output of each line in our script.

To Run the Script
- R should be installed on the computer.
- Next go into the Scripts folder and open the script using R.
- Then just click at the top of the script and click run so it steps through each line and executes the command. (The script is commented so you will know what is expected.)
- We recommend taking a look at the output in the output folder to see what the results should look like.
